Overview. A uniform, polymer (often referred to as a monodisperse polymer) is composed of molecules of the same mass. Nearly all natural polymers are monodisperse. Synthetic near-monodisperse polymer chains can be made by processes such as anionic polymerization, a method using an anionic catalyst to produce chains that are similar in length. This technique is also known as living polymerization.

Dispersity - Wikipedia

Thanks for your answers. My question was mainly about the method that Aspen Plus applies in calculating the vapor pressure of the compounds in the case we are using an equation of state.

Where does ASPEN Plus calculate the vapor pressure of ...

A chemical reactor is an enclosed volume in which a chemical reaction takes place. In chemical engineering, it is generally understood to be a process vessel used to carry out a chemical reaction, which is one of the classic unit operations in chemical process analysis. The design of a chemical reactor deals with multiple aspects of chemical engineering.

Chemical reactor - Wikipedia

Hollow fiber modules designed for pressure-driven filtration are generally configured as parallel flow devices such as the contactor shown in Fig. 2, where the two fluids flow parallel to each other on opposite sides of the membrane. In principle, there is no reason why these filtration modules cannot be used for concentration-driven fluid/fluid mass transfer, where their simplicity (hence ease ...

This work was performed to extract oil from Jatropha seeds and to study the optimum conditions of extraction. The extraction process was observed with regard to oil yield percent versus time to calculate the kinetic and thermodynamic parameter. On the other hand, Jatropha oil was used as feed stock for biodiesel production by alkali catalyzed methanolysis.

25 000 00 (2): 1983, 1984 KAIST 00000 A gas cylinder of 10 ft³ volume containing nitrogen initially at a pressure of 10 atm and a temperature of 230K, is connected to another cylinder of 10 ft³ volume which is evacuated. A valve between the two cylinders is opened until the pressures in both cylinders equalize. Find the final temperature and pressure in each cylinder if there ...

In chemical industries, various types of FBRs such as bubbling fluidized bed, circulating fluidized bed, turbulent fluidized bed, floating fluidized bed, twin fluidized bed and many other classifications based on flow regime and reactor design are used (Jordening and Buchholz, 1999). However, most of these have been developed for specific chemical applications, often involving very high ...
